ABSTRACT

The project objective is to book cinema tickets in online. The Ticket Reservation System is an Internet based application that can be accessed throughout the Net and can be accessed by anyone who has a net connection. This application will reserve the tickets. This online ticket reservation system provides a website for a cinema hall where any user of internet can access it. User is required to login to the system and needs a credit card for booking the tickets. Tickets can be collected at the counter and watching movies with family and friend sin theatres is one of the best medium of entertainment after having a hectic schedule. But all this excitement vanishes after standing in hours in long queues to get tickets booked. The website provides complete information regarding currently running movies on all the screens with details of show timings, available seats. Ticket reservations are done using credit card and can be cancelled if needed. Our online tickets reservation system is one of the best opportunities for those who cannot afford enough time to get their tickets reserved standing in long queues. People can book tickets online at any time of day or night. Our reservation system also provides option to cancel the tickets which are reserved previously.

Keywords: Online Ticket Reservation, Movie Booking System, Web Application, Cinema Ticketing, Seat Availability, Show Timings, User Authentication, Credit Card Payment, E-Ticketing, Ticket Cancellation, Internet-Based System, Online Reservation, Movie Management System, Customer Convenience, Real-Time Booking

TABLE OF CONTENTS

Chapter 1

INTRODUCTION

1.1 Introduction

The **Online Movie Ticket Booking System** is a user-friendly web-based platform designed to simplify the process of booking movie tickets. In the traditional system, customers have to visit theatres physically, stand in queues, and manually select shows and seats. This system eliminates such inconveniences by offering a digital interface where users can view running movies, check seat availability, choose preferred show timings, and make payments online.

With the growing use of the Internet and smartphones, online booking has become an essential feature for cinema management. This project allows users to create an account, log in securely, and perform transactions in a few clicks. It not only enhances customer convenience but also helps theatre administrators manage bookings, seat arrangements, and cancellations more efficiently. The platform can be accessed anytime and from anywhere, making it suitable for both urban and rural users with Internet access.

1.2 Aim of the project

The primary aim of this project is to develop a **secure, efficient, and automated movie ticket booking system** that allows users to book, manage, and cancel movie tickets online.
It intends to minimize manual work, reduce human error, and improve the overall customer experience in the entertainment sector.
Key objectives include:

- To enable users to book movie tickets conveniently through a website.
- To reduce waiting time and crowding at cinema counters.
- To provide real-time updates on available seats and show timings.
- To ensure secure payment options and maintain customer data privacy.
- To offer an easy-to-use interface for both customers and administrators.

1.3 Project Domain

This project belongs to the **Web-Based Application Development** and **E-Commerce** domains. It integrates several areas of computer science such as:

- **Database Management Systems (DBMS):** For storing user, movie, and booking data.
- **Web Technologies:** HTML, CSS, JavaScript for the front-end; PHP or Python for back-end logic.
- **Payment Systems:** Integration with online payment gateways for secure transactions.
- **Networking and Security:** To ensure safe access and protection from unauthorized use.

By combining these technologies, the system creates a complete environment for users to perform all booking-related tasks online without external assistance.

1.4 Scope of the Project

The **scope** of this project is broad, covering both customer-side and admin-side functionalities.

For Users:

1. Create an account and log in securely.
2. Browse movies currently playing and upcoming.
3. Check show timings, seat layouts, and prices.
4. Book tickets using debit/credit cards or online payment gateways.
5. Receive digital confirmation of booking via email or SMS.
6. Cancel or modify booked tickets when necessary.

For Administrators:

1. Manage theatres, screens, and movie schedules.
2. Update seat availability dynamically after each booking.
3. View customer booking records and generate reports.
4. Handle user queries and maintain system logs.

The system can be scaled further to include **multi-theatre management**, **mobile app integration**, **QR-code ticket validation**, and **loyalty rewards**. It is suitable for implementation in multiplexes, cinema chains, and local theatres.

1.5 Methodology

The development process of this project follows the **System Development Life Cycle (SDLC)** methodology to ensure a structured and reliable system.

1. Requirement Analysis:

Understanding user needs, such as booking process, show timing updates, and payment options. Gathering functional and non-functional requirements from theatre managers and customers.

2. System Design:

Designing the database schema (for users, movies, bookings, and payments), creating data flow diagrams (DFDs), and developing an intuitive user interface with easy navigation and responsiveness.

3. Implementation:

The application is developed using technologies like HTML, CSS, and JavaScript for front-end design, and PHP with MySQL for back-end processing. Payment modules and authentication are integrated securely.

4. Testing:

Various testing methods such as unit testing, integration testing, and system testing are performed to detect and fix errors. Testing ensures that the system is efficient, reliable, and performs under all conditions.

5. Deployment:

After successful testing, the application is hosted on a web server for public use. Continuous monitoring ensures smooth functioning.

6. Maintenance:

Regular updates, security checks, and feature enhancements are performed based on user feedback and technological advancements.

Chapter 2

REQUIREMENT SPECIFICATION

This chapter outlines the various requirements needed for the development and operation of the Online Movie Ticket Booking System. It defines the characteristics of users, the system's dependencies, and both hardware and software requirements essential for successful implementation.

2.1 User characteristics

The Online Movie Ticket Booking System is designed to be used by two main types of users:

1. Customers (End Users):

1. Should have basic knowledge of operating a computer or mobile device.
2. Must be familiar with web browsing and online payment methods.
3. Can register, log in, view movies, book tickets, and cancel bookings.
4. Expect a simple, interactive, and secure interface for performing tasks quickly.

2. Administrators (Theatre Managers):

1. Should have basic technical knowledge to manage the website backend.
2. Responsible for adding and updating movie details, show timings, and seat availability.
3. Should be able to monitor bookings and generate reports.
4. Ensure proper system maintenance and data accuracy.

2.2 Dependencies

The system depends on several external and internal factors for smooth functioning:

1. **Internet Connection:** Required for accessing the application and performing real-time bookings.
2. **Web Browser:** Compatible with popular browsers such as Chrome, Firefox, and Edge.
3. **Payment Gateway Integration:** To process secure online transactions through debit/credit cards or UPI.
4. **Database Connectivity:** Reliable database server to manage user and booking data efficiently.
5. **Server Hosting:** The website should be hosted on a secure web server for 24/7 accessibility.
6. **Email/SMS Services:** To send booking confirmations, notifications, and ticket details to users.

2.3 Hardware specification

Component	**Minimum Requirement**	**Recommended Requirement**
Processor	Intel Core i3 or equivalent	Intel Core i5/i7 or higher
RAM	4 GB	8 GB or more
Hard Disk	250 GB	500 GB or more
Monitor	15-inch display	17-inch or Full HD display
Internet	2 Mbps connection	5 Mbps or higher broadband
Input Devices	Keyboard, Mouse	Keyboard, Mouse, Touchscreen (optional)

2.4 Software specification

Category	**Software/Tool Used**
Operating System	Windows 10 / Linux / macOS
Front-End Technologies	HTML, CSS, JavaScript
Back-End Technologies	PHP / Python (Flask or Django)
Database	MySQL / MariaDB
Web Server	XAMPP / WAMP / Apache Server
IDE / Editor	Visual Studio Code / Sublime Text
Browser	Google Chrome / Mozilla Firefox
Payment Integration	Razorpay / PayPal / Stripe (optional)

Chapter 3

WEBSITE DESIGN

3.1 Sitemap

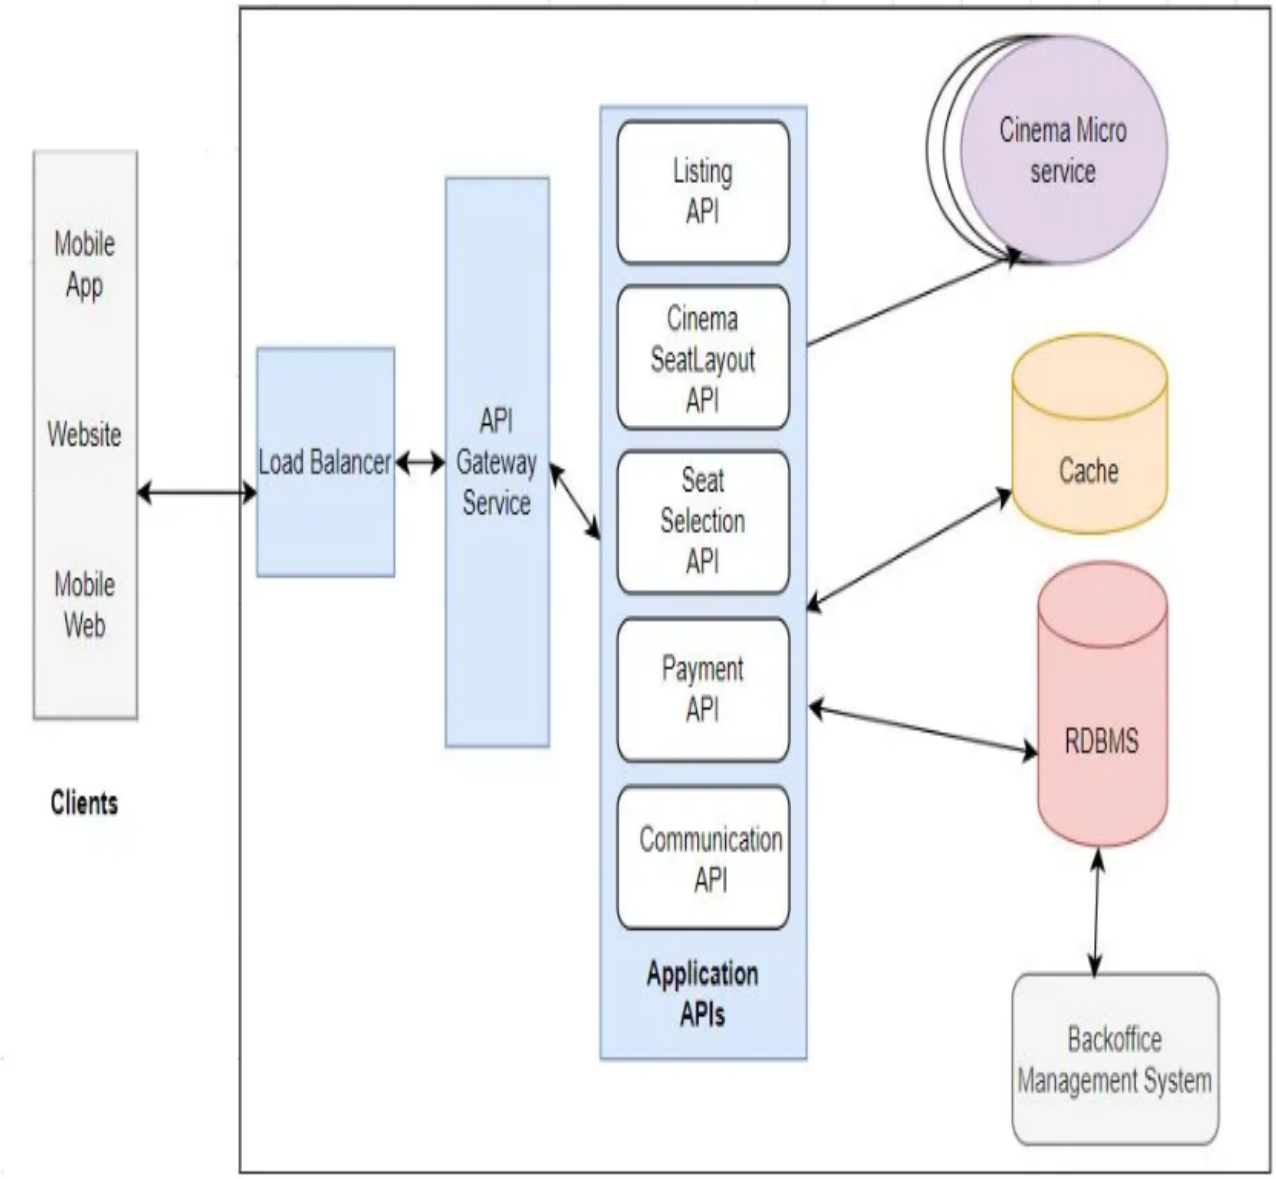

Figure 3.1: **Architecture Diagram**

.

3.2 Design Phase

The design phase is an essential step in software development that focuses on transforming the requirements gathered during the analysis phase into a structured system design. It provides a blueprint for developers to follow during implementation. For the *Online Movie Ticket Booking System*, this phase involves designing system architecture, data flow, user interfaces, and database structures to ensure efficient, secure, and user-friendly performance.

3.2.1 Data Flow Diagram

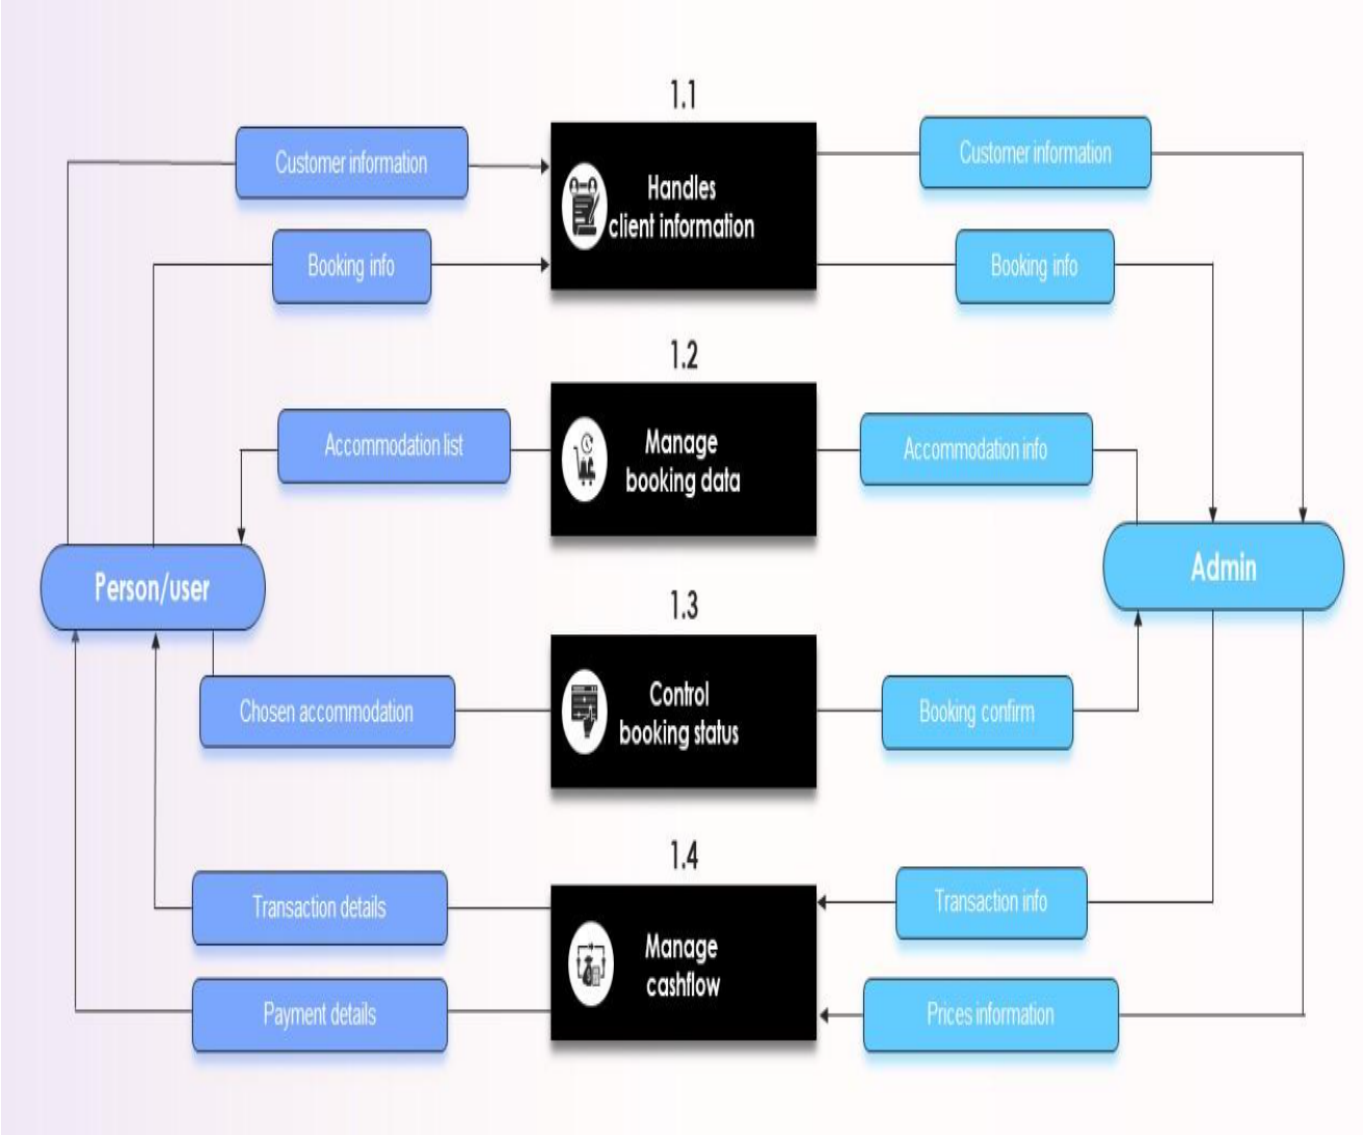

Figure 3.2: **Data Flow Diagram**

3.3 Front End and Back End Design

3.3.1 Home Page

The Home Page is the primary landing entry point for all users. Its design must be engaging, informative, and provide a clear path to the core user flow (booking a ticket).

Key Components:

1. **Navigation Bar:** A sticky header containing the site Logo, links to ”Movies,” ”Theaters,” ”Offers,” and ”Login/Signup” buttons. After login, this will show a user’s profile icon.
2. **Location/City Selector:** A prominent feature, often near the navigation, allowing users to set their location, as movie listings are location-dependent.
3. **Main Carousel:** A large, high-definition carousel showcasing featured movies (e.g., ”Now Showing,” ”Upcoming Blockbusters”) with ”Book Now” call-to-action buttons.
4. **Search Bar:** A central search bar for users to find movies by title, theater, or genre.
5. **Movie Listings:** The main body of the page, organized into tabbed sections or horizontal carousels:
    - **Now Showing:** Displays movie posters, titles, and genres for currently running films.
    - **Coming Soon:** Builds anticipation for upcoming releases.
6. **Filters:** Basic filters (e.g., by Language, Genre) might be present on the sidebar or above the listings to help users narrow their search.
7. **Footer:** Contains links for ”About Us,” ”Contact Support,” ”FAQ,” and ”Social Media.”

3.3.2 Signup and Login page

Authentication is crucial for managing user bookings, payments, and history.

- **Signup Page:**
    1. **Form Fields:** Full Name, Email Address, Phone Number (for ticket/OTP verification), Password, and Confirm Password.
    2. **Social Logins:** Buttons for ”Sign up with Google” and ”Sign up with Facebook” (using OAuth 2.0) to provide a faster registration path.
    3. **Validation:** Client-side validation for all fields (e.g., valid email format, password strength).

4. **Link:** A clear link to the Login page for existing users.

- **Login Page:**

1. **Form Fields:** Email (or Phone Number) and Password.
2. **Features:** ”Forgot Password?” link (which triggers a password reset email) and a ”Keep me logged in” checkbox.
3. **Social Logins:** Matching Google/Facebook login buttons.
4. **Link:** A clear link to the Signup page for new users.

Back-End: Upon successful login, the server will generate a **JSON Web Token (JWT)**, which is sent to the client. This token is then included in the header of all subsequent API requests to authenticate the user.

3.3.3 Form Validation

Form validation is the process of **checking user input** in a web form to ensure that all entered data is **correct, complete, and in the right format** before it is submitted.

Types of Form Validation

1. **Client-Side Validation:**
   (a) Done in the user's browser using **JavaScript or HTML5**.
   (b) Gives instant feedback (e.g., “Email is required”).
   (c) Example: Checking if all fields are filled or if an email is in proper format.
2. **Server-Side Validation:**
   (a) Performed on the **server** after the form is submitted.
   (b) Ensures data security and prevents invalid or malicious input.

3.3.4 Parse the webpage using Jquery and DOM

In an **Online Movie Ticket Booking System**, webpage parsing means extracting data like **movie names, showtimes, and seat availability** from HTML elements.

- **DOM (Document Object Model):** Represents the webpage structure as a tree of elements that can be accessed and modified using JavaScript.
- **jQuery:** Simplifies working with the DOM. It helps easily select HTML elements, read or change their content, and handle user actions.

Process:

1. Wait until the webpage loads.
2. Use jQuery or DOM methods to select elements (like movies, seats, or forms).
3. Extract text or attributes from those elements.
4. Use the extracted data for display, validation, or booking functions.

—

3.3.5 Creation of Webserver using Node Js

The back-end API will be built using Node.js, specifically with the **Express.js** framework, due to its speed and efficiency with I/O operations.

This server acts as the central hub (or API gateway) that the Angular application communicates with.

3.3.6 Design of Three Tier application using Node js and MySQL

The system uses a standard three-tier architecture to separate concerns.

1. **Tier 1: Presentation (Client): Angular** application running in the user's browser. Renders the UI and captures user input.
2. **Tier 2: Application/Logic (Server): Node.js + Express.js** server. Contains all business logic, validates users, and processes requests.
3. **Tier 3: Data (Database): MySQL** database. Stores all persistent data in tables. **Example Tables:** `Users`, `Movies`, `Theaters`, `Showtimes`, `Seats`, `Bookings`.

3.3.7 Design of Reactive form for User Registration using Angular

User registration is handled using Angular's **Reactive Forms**.

This model-driven approach defines the form's structure, validation rules (e.g., `Validators.required`, `Validators.email`, `Validators.minLength`), and custom validators (like password matching) in the component's TypeScript code, providing a robust way to manage form state.

3.3.8 Develop web application to implement routing and navigation in Angular

Navigation between different pages (components) is managed by Angular's `RouterModule`.

The `app-routing.module.ts` file defines all application routes (e.g., `path: 'movie/:id'`). An `AuthGuard` is used to protect routes that require login (e.g., the booking page). The main `app.component.html` uses `<router-outlet>` as a placeholder to render the component for the current route.

3.3.9 Creation of Microservices

For scalability, the single Node.js server (monolith) can be broken down into a **Microservice Architecture**. The back-end is split into smaller, independent services, each with one responsibility.

- **Example Services:**
    1. **User Service:** (Registration, Login, Profiles)
    2. **Movie & Showtime Service:** (Movie catalog, showtimes)
    3. **Booking Service:** (Handles seat selection, locking, and booking)
    4. **Payment Service:** (Integrates with payment gateways)
    5. **Notification Service:** (Sends email/SMS confirmations)
- **Communication:** Services communicate via an **API Gateway** (for client requests) and a **Message Queue** (like RabbitMQ or Kafka, for service-to-service events).

3.3.10 Deployment of Microservices

Microservices are deployed using **containers** and **orchestration** for automation and scaling.

1. **Containerization (Docker):** Each microservice is packaged into a lightweight, portable **Docker image** using a `Dockerfile`. These images are stored in a container registry.
2. **Orchestration (Kubernetes - K8s):** Kubernetes automates the deployment, scaling, and management of the Docker containers. We define the desired state in YAML files (e.g., `deployment.yaml`, `service.yaml`) and Kubernetes handles the rest, allowing services to be scaled independently (e.g., increasing only the `Booking Service` during high demand).

Chapter 4

TESTING

4.1 Testing

The testing phase focused on verifying both functional and non-functional requirements of the system. Several types of testing were conducted, including unit testing, integration testing, system testing, and user acceptance testing.

Unit Testing: Each module, such as login, registration, movie selection, and payment, was tested individually to ensure that it performs as expected. Errors were corrected before integrating with other modules.

Integration Testing: After individual modules were verified, they were combined and tested to ensure that data flow and communication between modules were functioning correctly.

System Testing: The complete system was tested as a whole to verify that all components work together and meet user requirements.

User Acceptance Testing (UAT): This testing was conducted with real users to ensure that the system provides an intuitive interface and meets end-user expectations.

All these testing stages ensured that the final system was robust, efficient, and user-friendly.

4.1.1 Test Result

The testing process yielded successful results across all modules of the system.

- The **login and registration** modules functioned properly with validation checks.
- The **movie listing** and **booking** modules provided accurate movie information, showtimes, and seat availability.
- **Payment integration** worked seamlessly with test data, confirming secure and error-free transactions.
- The **admin panel** correctly displayed user records, bookings, and allowed updates or deletions.
- Performance and load testing showed that the website can handle multiple simultaneous users effectively.

Overall, the system met all functional requirements and performed well under different test scenarios.

4.1.2 Test Bugs

During testing, a few bugs were identified and resolved to improve system stability and performance.

S.No	Bug Description	Type	Status
1	Login failed when input fields were empty	Validation error	Fixed
2	Incorrect seat count after booking cancellation	Logic error	Fixed
3	Page layout issues on mobile devices	UI bug	Fixed
4	Payment timeout during heavy traffic	Performance issue	Fixed
5	Admin panel not updating user data instantly	Database sync issue	Fixed

Chapter 5

WEBSITE LAUNCH

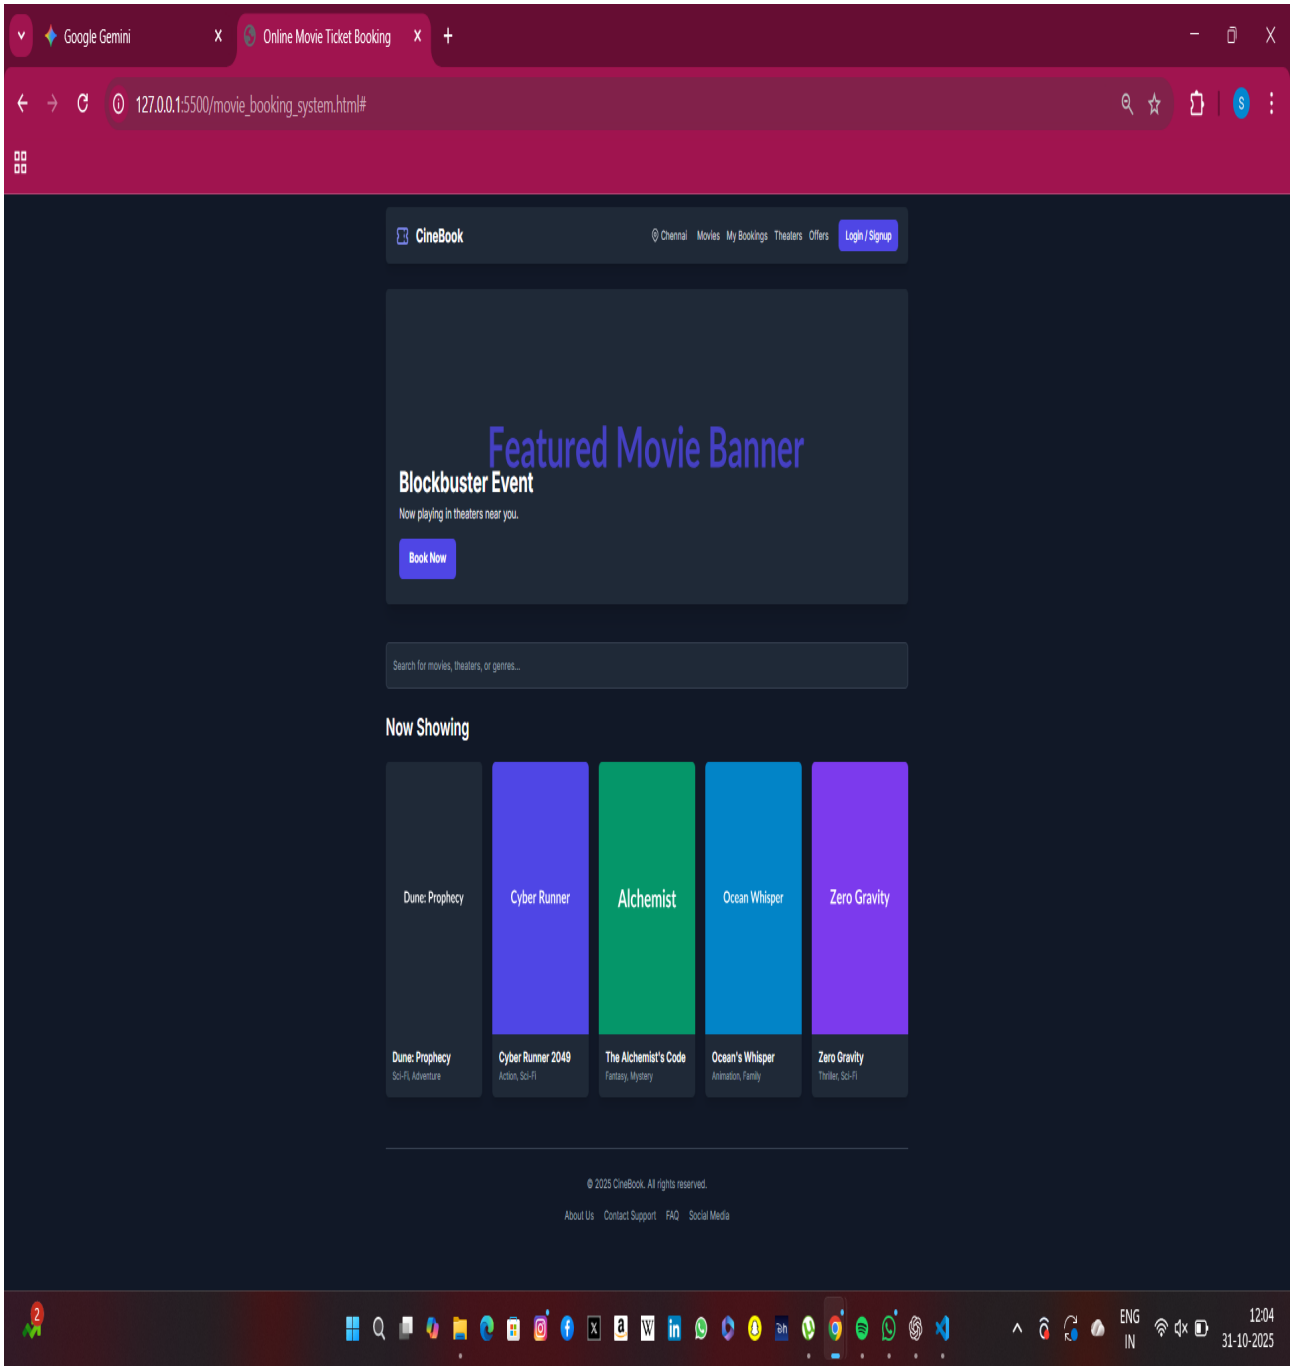

Figure 5.1: **Test Image**

Chapter 6

RESULTS AND DISCUSSIONS

6.1 Website performance

The performance of the **Online Movie Ticket Booking System** was evaluated based on its speed, reliability, and user experience.

1. The website loads quickly and performs efficiently even under high user traffic.
2. The booking process is fast and straightforward, requiring minimal navigation.
3. Real-time updates for movie availability, seat selection, and ticket confirmation ensure accuracy and convenience.
4. The database efficiently handles multiple user requests simultaneously without delays.
5. Overall, the system achieves high responsiveness with optimized queries and lightweight web components.

Performance testing shows that the system can manage concurrent bookings smoothly and provide a seamless experience for users.

6.2 Security

Security is one of the most important aspects of an online booking system. This project includes several security features to protect user data and ensure safe transactions.

1. Passwords are stored securely using encryption techniques.
2. Login validation prevents unauthorized access and misuse of credentials.
3. Secure Socket Layer (SSL) can be implemented to encrypt communication between the client and the server.
4. The payment process is handled securely using integrated payment gateways, ensuring confidentiality of card details.

5. Admin access is restricted and monitored to maintain data integrity and prevent misuse.

These measures ensure that users can confidently book their tickets online without worrying about data theft or privacy issues.

6.3 Responsiveness and mobile-friendliness

The website is designed with a **responsive layout** that adapts to different screen sizes, ensuring a consistent user experience across desktops, laptops, tablets, and mobile phones.

1. The front-end uses **HTML5**, **CSS3**, and **JavaScript** to create a flexible, device-friendly interface.
2. The layout automatically adjusts to various screen resolutions for better accessibility.
3. Buttons, navigation menus, and input fields are optimized for touch and click interactions.
4. The mobile version allows users to perform all major functions such as login, movie search, booking, and payment without any lag.

The system's responsiveness and mobile adaptability make it more convenient for users, allowing ticket booking from any device at any time.

Chapter 7

CONCLUSION AND FUTURE ENHANCEMENTS

7.1 Conclusion

The **Online Movie Ticket Booking System** provides an effective solution for automating the traditional ticket booking process. It enables users to browse movies, check show timings, view seat availability, and book tickets online with ease. The system eliminates the need to stand in long queues at cinema halls, saving both time and effort for customers.

By integrating features such as **user authentication, real-time seat availability, and secure online payment**, the system ensures reliability, accuracy, and convenience. The use of modern web technologies like **HTML, CSS, JavaScript, PHP, and MySQL** allows smooth data handling and an interactive interface.

From the administrator's perspective, the system helps in **managing movies, schedules, ticket sales, and user information** efficiently. It also maintains proper records for future reference and minimizes manual errors.

Overall, the project demonstrates how technology can transform the entertainment industry by offering a **user-friendly, fast, and secure online platform** for ticket reservations. This system can be further enhanced by adding features such as mobile app integration, QR-based ticket validation, and personalized movie recommendations in the future.

7.2 Future Enhancements

Although the current system provides an efficient platform for online booking, it can be further improved with additional features and technologies. Some possible enhancements include:

1. **Mobile Application Integration:** Developing an Android/iOS app for users to book tickets on the go.
2. **QR Code / E-Ticket System:** Generating QR-based tickets that can be scanned directly at theatre entrances.
3. **AI-Based Recommendations:** Suggesting movies to users based on their viewing history and preferences.
4. **Multi-Theatre and Multi-City Support:** Expanding the system to manage bookings across multiple cinema chains and cities.
5. **Advanced Payment Options:** Integrating wallets, UPI, and cryptocurrency payments for more flexibility.
6. **Customer Feedback System:** Allowing users to rate movies and theatre services for quality improvement.
7. **Cloud Deployment:** Hosting the system on the cloud for better scalability and performance.

These future enhancements will make the system more intelligent, user-centric, and scalable to meet the growing demands of the digital entertainment industry.
